Features

- Direct-acting solenoid direction shut-off valve
- Mounting face as per DIN24 340 A
- ISO 4401 and CETOP-RP 121H
- Free of leakage
- Switching flexibility in high-pressure state
- Replace the coil, can take pressure operation
- Solenoid coil can rotate for 90 degrees
- Manual emergency operation available

Function and configuration

M-SEW6 direction valve is a solenoid shut-off directional poppet valve for control oil opening, stop and flow direction. Two-position TEE solenoid directional poppet valve consists of valve body (1), Solenoid (2), and valve element (3). Connect a superposition plate below the two-position TEE solenoid directional poppet valve to connect valve body (4), it becomes into two-position four-way direction poppet valve. The manual emergency button (5) can be used to operate the valve when the Solenoid is not powered on.

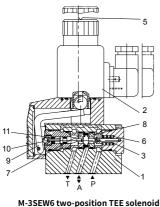

M-3SEW6 two-position TEE solenoid directional poppet valve

1). Initial position:

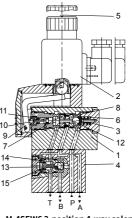

when the Solenoid is not energized, pretention of spring (6) keeps valve element (3) on valve seat (7) on the left, so that oil port P is connected to A and oil port T is closed.

2). Switching position:

after the Solenoid is energized, through angular lever (9) and ball (10), the force of Solenoid (2) acts on push rod (11) of the two-side seal, thus to push valve element (3) and maintain it on right valve seat (8), causing oil port P closed and oil port A connected to port T. Since push rod (11) and valve element (3), acted by the inlet pressure, is in a balance state of axial hydraulic pressure, the valve can be used when pressure is up to 420bar.

M-4SEW6 2-position 4-way solenoid directional poppet valve

$\cdot\,$ M-4SEW6 2-position 4-way solenoid directional poppet valve

1). Initial position:

when the Solenoid is not energized, pretention of spring (6) keeps valve element (12) on valve seat (8) on the right, oil port P is closed and port A connected to T; pressure oil supplied from oil port P push steel ball (13) to valve seat (14), upon which oil port P is connected to B and A connected to T; besides, a control oil line is connected from oil port A acts on the big area of control piston (15), which can be used for unloading to oil tank.

2). Switching position:

after the Solenoid is energized, oil port P is connected to A; pressure oil from the pump goes through the control oil line connected from port A and acts on the big area of control piston (15); steel ball (13) is pushed to the other side of valve seat (14), thus oil port P is connected to A and B connected to T.

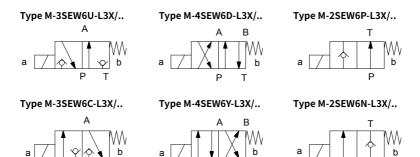

· Cartridge restriction choke (model M-.SEW6.L3X/.../B...)

To restrict flow through the valve, a restriction choke can be installed. Restriction choke is installed on port P.

• Cartridge type one-way valve (model M-.SEW6.L3X/.../P) Cartridge type one-way valve allows oil flow in from port P and it is closed for reverse flowing. One-way valve installed on port P.

- ISO 4401 and CETOP-RP 121H
- Free of leakage
- Keeping switching flexibility in high-pressure state
- DC Solenoid of removable coil
- Solenoid coil can rotate for 90 degrees
- Optional manual emergency operation

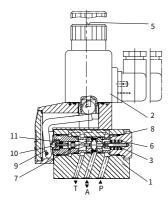

Function and configuration

M-SEW10 directional valve is a solenoid shut-off directional poppet valve for control oil opening, stop and flow direction. Two-position three-way solenoid directional poppet valve main consists of valve body (1), Solenoid (2), and valve element (3). Connect a superposition plate below the two-position three-way solenoid directional poppet valve to connect valve body (4), it becomes into two-position four-way direction poppet valve. Manual emergency button (5) can be used to operate the valve when the solenoid is not powered on.

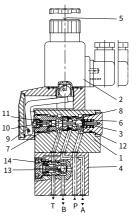

\cdot M-3SEW10 two-position TEE solenoid directional poppet valve

1). Initial position: when the solenoid is not energized, pretention of spring (6) keeps valve element (3) on valve seat (7) on the left, so that oil port P is connected to A and oil port T is closed.

2). Switching position: after the solenoid is energized, through angular lever (9) and ball (10), the force of Solenoid (2) acts on push rod (11) of the two-side seal, thus to push valve element (3) and maintain it on right valve seat (8), causing oil port P closed and oil port A connected to port T. Since push rod (11) and valve element (3), acted by the inlet pressure, is in a balance state of axial hydraulic pressure, therefore, the valve can be used when pressure is up to 420bar.

M-3SEW10 two-position TEE solenoid directional poppet valve

M-4SEW10 2-position 4-way solenoid directional poppet valve

• M-4SEW10 2-position 4-way solenoid directional poppet valve 1). Initial position:

when the Solenoid is not energized, pretention of spring (6) keeps valve element (12) on valve seat (8) on the right, oil port P is closed and port A connected to T; pressure oil supplied from oil port P push steel ball (13) to valve seat (14), upon which oil port P is connected to B and A connected to T; control oil line is connected from oil port A acts on the larger area of control piston (12), which can be used for unloading to oil tank.

2). Switching position:

after the Solenoid is energized, oil port P is connected to A; pressure oil from the pump goes through the control oil line connected from port A and acts on the larger area of control piston (12); steel ball (13) is pushed to the other side of valve seat (14), thus oil port P is connected to A and B connected to T.

·Cartridge restriction choke (model M-.SEW10.L1X/../B...)

To restrict flow through the valve, a restriction choke can be installed. Restriction choke is installed on port P.

·Cartridge type one-way valve (model M-.SEW10.L1X/../P)

Cartridge type one-way valve allows oil flow in from port P and it is closed for reverse flowing. One-way valve installed on port P.
