### **Features**

- Pilot operated valve for reducing a pressure (P to A) and limiting (A to T) a system pressure
- Actuation by proportional solenoid
- Maximum pressure relief function, optional
- Valve and control electronics from a single source
- Control electronics for type 3DRE(M):
  - Analogue amplifier type VT-VSPA1(K)-1in Euro-card format
  - Digital amplifier type VT-VSPD-1 in Euro-card format
  - Analogue amplifier type VT 11131 of modular design
- Linear command value/pressure characteristic curve
- Integrated electronics (OBE) with type 3DRE(M)E:
- Low manufacturing tolerance of the command value/
- pressure characteristic curve
   Ramp times can be adjusted separately for pressure build-up

# **Function and configuration**

Valves of types 3DRE(M) and 3DRE(M)E are electrically pilot operated 3-way pressure reducing valves with pres-sure relief function for the actuator. They are used to reduce a system pressure.

### **Technical structure:**

The valves consist of three main assemblies:

- 1) Pilot valve (1) optionally with maximum pressure relief function (16)
- 2) Proportional solenoid (2)
- 3) Main valve (3) with main spool (4)

### **Function:**

General function:

Command value-related adjustment of the pressure to be reduced in channel A by proportional solenoid (2).

When no pressure is applied in port P, main spool (4) is held by springs (5) and (6) in the central position. Here, the connections from P to A and A to T are closed. Pilot oil flows from bore (7) via flow controller (8), pilot valve (1) to orifice (9), throttling gap (10), pipe (11) to port Y. This port must be connected at zero pressure to the tank.

Type 3DREM10P-L6X/...G24K4V

### Pressure reduction:

Build-up of pilot pressure in control chamber (12) as a function of the command value. Pressure is built up in spring chamber (14) via orifice (13) and the main spool is shifted to the right. Hydraulic fluid flows from P to A. The actuator pressure in port A is applied to spring chamber (15).

An increase in the pressure in port A to the pressure set on pilot valve (1) causes main spool (4) to be pushed to the left. The pressure in port A becomes virtually the same as the pressure set on pilot valve (1).

### Pressure relief function:

When the pressure in port A exceeds the pressure set on pilot valve (1), main spool (4) is shifted further to the left. This causes the connection from A to T to open and limits the pressure applied in port A to the set command value.

### Type 3DREM:

The valve is optionally available with an additional spring-loaded pilot valve (16) to provide a maximum pressure relief function.

### Types 3DREE and 3DREME

with integrated electro-nics (OBE):

In terms of function and structure, these valves correspond to types 3DRE and 3DREM, except for the integrated electronics.

The electronics receives the supply and command value voltage via cable socket.

The command value/pressure characteristic curve (zero point on spindle (17) and the gradient are adjusted in the factory with narrow tolerances on the Imax potentiometer in the electronics.

The ramp time for pressure build-up and pressure reduction can be adjusted independently of each other with the help of two potentiometers.

· For type 3DRE(M)E (with integrated electronics (OBE))

For pin allocation also see block circuit diagram. Plug-in connector to DIN EN 175201-804

# Integrated electronics (OBE) of Types DREE and DREME

### **Function:**

The integrated electronics is controlled via the two differential amplifier connections D and E.

The ramp generator generates from a command value step change (0 to 10 V or 10 to 0 V) a delayed increase or drop of the solenoid current.

Potentiometer R14 can be used to adjust the rise time, potentiometer R13 to adjust the drop time of the solenoid current.

The maximum ramp time of 5s is only possible over the full command value range. In the case of minor changes in the command value, the ramp time shortens accordingly.

The command value/solenoid current characteristic curve is adjusted to the valve by means of the characteristic curve generator so that non-linearities in the hydraulic system are compensated for and a linear command value/pressure characteristic curve is obtained.

The current regulator regulates the solenoid current independently of the solenoid coil resistance.

Potentiometer R30 can be used to change the gradient of the command value/current characteristic curve and hence the gradient of the command value/pressure characteristic curve of the proportional pressure control valve.

Potentiometer R43 serves for adjusting the biasing current. This setting should not be changed. If required, adjust the zero point of the command value/pressure characteristic curve onthe valve seat.

A chopper amplifier forms the power stage of the electronics for controlling the proportional valve. It is pulsewidth-modulated with a clock frequency of 300 Hz.

The solenoid current can be measured at both measuring sockets MP1 and MP2. A voltage drop of 0.352V at the measuring resistor corresponds to a solenoid current of 1.6 A.

# · Supply voltage

Power supply unit with rectifier. Single-phase rectification or three-phase current bridge: U<sub>eff</sub> =22 to 33V Residual ripple content on the power supply unit: < 5 %

Output current: I<sub>eff</sub> = max. 1.4A Supply cable:

- Recommended: 5-wire, 0.75 or 1 mm<sup>2</sup> with protective conductor and shield
- Outer diameter 6.5 to 11 mm
- Shield to 0 V supply voltage
- Max. permissible length 100 m

The minimum supply voltage of the power supply unit depends on the length of the supply cable (see diagram). In the case of lengths >50 m, a capacitor of 2200μ must be provided in the supply cable in the vicinity of valve.
