Function, section and symbol

• General

The 2-way cartridge valves for pressure control functions are pilot operated poppet or spool valves. The main component designed as a cartridge valve (1) is inserted in a hole bore standardized to DIN ISO 7368 and is sealed by control cover (2).

The pilot valve (4) is integrated into the control cover (2) or mounted onto the control cover as a pilot valve with interface connections to DIN 24 340 (2). Different pressure functions can be realized by combining the cartridge valve with the control covers.

Type L-LC..DB..D... Type L-LC..DB..E...

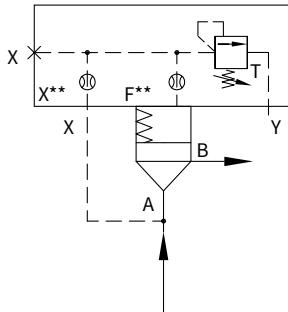

05

• Pressure relief function

Control cover type L-LFA..DB...

Cartridge valve type L-LC..DB...

The cartridge valve (1) for the pressure relief function (type L-LC .. DB...) is a poppet valve with a area ratio of 1:1 (no effective area at port B). The pressure acting at port A is fed via the pilot oil supplying orifice (5) to the main spring chamber (6). At pressures below the setting of pilot valve (4) the forces on spool (3) are balanced and the spool remains closed due to the spring force. On reaching the set pressure, spool (3) opens and limits the pressure at port A in line with the pressure-flow characteristics.

Type L-LFA..DB...

Type L-LC..DB...

Function, section and symbol

• Pressure reducing function

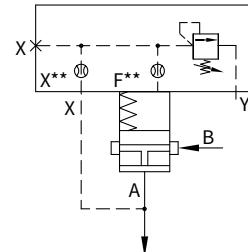

a) Normally open:

Control cover type L-LFA...DB...

Cartridge valve type L-LC..DR...

The cartridge valve for the pressure reducing function is a poppet valve with a area ratio of 1:1 (no effective area at port B), adopting the same types of cover (type LFA ..DB...) used as pilot valves which are used for the pressure relief functions.

The pressure fed via the pilot oil orifice is acting on the main spring chamber. When pressure is below the setting of pilot valve, the forces on spool are balanced and the spool remains open due to the spring force. Consequently, fluid flows port B to port A free. On reaching the set pressure, spool closes and reduces the pressure at port A in line with the pressure-flow characteristics.

E.g. Type L-LFA..DB...

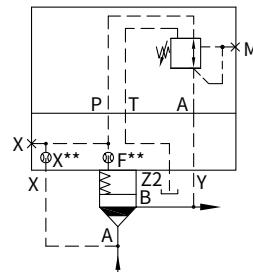

Type L-LC..DR40...

b) Normally closed:

Control cover type L-LFA...DR...

Cartridge valve type L-LC..DB...D...

For the pressure reducing function with opening characteristics, a pressure relief valve cartridge (type L-LC..DB..D...) and a control cover with a pressure reducing valve (type L-LFA..DR...) as the pilot valve are used. The pilot oil is fed from port A via the pilot orifice and the open pressure reducing valve to side B. The main spool opens and allows free flow from port A to port B. On reaching the setting pressure, the main spool closes and reduces the pressure at port B in line with the pressure-flow characteristics. If excess pressure occurs on the pressure reducing side, pressure relieves via the third port of the pilot valve. By fitting a directional valve, an additional isolating function can also be attained (type L-LFA..DRW...).

E.g. Type L-LFA..DR...

Type L-LC..DB40D...

Function, section and symbol

• Pressure sequencing function

Control cover type LFA..DZ...

Cartridge valve type LC..DB...

This function enables a pressure-dependent sequencing of a second system.

The required sequencing pressure is set by the pilot valve which is integrated into the control cover. The pilot oil supply may be either external (pilot oil port X) or internal (from port A via pilot oil port X or Z2).

The spring chamber of the pilot control is drained at zero pressure via ports Y or Z1 to tank.

When the pressure set at the pilot control spring is reached, the pilot valve switches and unloads the spring chamber of the main valve to tank. The main spool opens and makes the connection from port A to B possible.

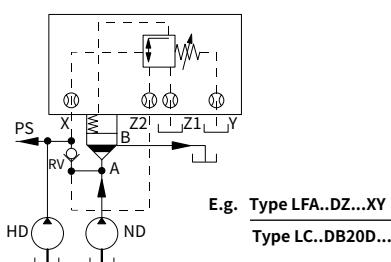

In version LFA..DZW..., the required spool position may be selected by means of an electrically operated pilot valve (not included with the scope of control cover LFA..DZW... supply) in addition to the normal hydraulic control.

Circuit examples

Example 1:

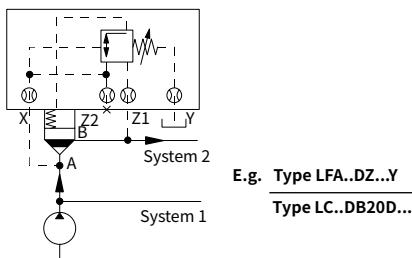

(circuit for the pressure dependent unloading of the low pressure system)

In the circuit shown, the system is fed by a high pressure pump and a low pressure pump. The system pressure PS acts externally from the high pressure side via the pilot oil port X on the pilot valve which, on reaching the set pressure, switches the low pressure side to give zero pressure circulation. The check valve RV (not included within the scope of supply) prevents the high pressure system from flowing into the low pressure system which is now at zero pressure.

Example 2: (circuit for the pressure dependent sequencing of a 2nd system)

With this circuit, oil is allowed to flow into system 2 when the pressure in system 1 has reached a pre-set value. The pilot oil supply is internal from port A of the main valve.

2-way cartridge valves -pressure control function

5.2-2(2)

Pressure reducing valve function

Control cover Type L-LFA.DR...

Technical data

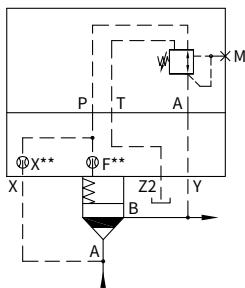

Fluid	Mineral oil suitable for NBR and FKM seal						
	Phosphate ester for FKM seal						
Fluid temperature range °C	-30 to +80 (NBR seal)						
	-20 to +80 (FKM seal)						
Viscosity range	mm ² /s	2.8 to 380					
Degree of contamination		Maximum permissible degree of fluid contamination: Class 9. NAS 1638 or 20/18/15 , ISO4406 ¹⁾					
Nominal size		16	25	32	40	50	63
Weight	kg	3.1	3.6	5.2	8	11.4	20.8

(L-LFA.DR (DRW) ...for applications outside these parameters, please consult us)

- ¹⁾ To prevent the problem caused by fluid contamination,
fluid cleanliness mentioned above must be met.

Control cover with pressure reducing function

Control cover		Control cover type L-LFA..DR.-.../ L-LFA..DRW.-.../...
Max. working pressure at the port...		315bar
...X (Basic pressure)		315bar
...Y (Secondary pressure=max. remove period setting pressure) ...Z2	As control pressure	0 pressure (up to 2bar)
	Static	60bar

Caution:

Composed with control cover type L-LFA..DR...and cartridge type L-LC..DB....

Pressure reducing function

Normally closed

Example: Type L-LFA..DR...
Type L-LC..DB 40 D...
